Hiring Team
Brightboard Learning

Dear Hiring Team,

I'm applying for the Junior Full-Stack Developer role. For 7 years I taught secondary math in Hamilton, and Brightboard works on the problem I kept running into as a teacher: grading faster and giving students feedback they actually read. I left teaching in 2025 to retrain as a developer, and teacher tools are the work I most want to do.

You asked about a time I solved a problem for a user. The first users were my colleagues and me. Grading our weekly quizzes took about 6 hours of every week. I wrote a Python tool on the Google Sheets API that grades the Google Forms quizzes and emails each student their feedback. Grading dropped to about 1 hour a week, and 5 other teachers in my math department started using it.

After a 24-week full-stack bootcamp, I built QuizLoop with one teammate: I wrote the Django REST Framework backend and the grading logic, with 85% test coverage in pytest. 3 teachers at my old school piloted it with about 90 students this spring. Since February I've also freelanced, building a Next.js and Django booking site for a tutoring centre that used to take every booking by phone. About 40 bookings a month now come through it.

My TypeScript and Docker experience comes from bootcamp exercises only, and I haven't used AWS. What I bring is Django, React, tests, and 7 years of working with teachers and students, the people your product is built for.

I'd be glad to talk about how I could help Brightboard's product team. Thank you for your time.

Sincerely,
Elena Torres
