Dear Hiring Team,

I'm applying for the Junior Software Engineer (New Grad 2026) role. Your posting says your users are city staff who are not technical, and that you care about clear, fast interfaces. The thing I'm proudest of building was for exactly that kind of user, so I wanted to tell you about it.

During my internship at Maplecrest Insurance, claims adjusters had to click through three screens to find a single claim. I built a search page in React.js backed by a Node.js and Express REST API, and wrote 40 Jest tests for it. My supervisor estimated that a lookup went from about 5 minutes to under 1 minute. At the end of the term I demoed it to the claims team of about 20 people it was built for.

Outside work, I helped build StudySpot with two teammates: a Next.js and PostgreSQL app that shows free study rooms on campus. I built the frontend and the job that syncs the room booking feed. About 600 students used it during the April 2025 exams, and it placed 2nd of 45 teams at Northgate Hacks 2025. As a teaching assistant, I also spent over a year explaining code to 30 beginners a week in a Python lab.

I haven't used D3 yet. Your dashboards are where I'd most like to learn it.

Thank you for reading. I'd love to talk about how I could help Corvid build tools that city staff enjoy using.

Sincerely,
Priya Shah
