Hiring Team
Quillstack

Dear Hiring Team,

I'm applying for the Staff Software Engineer, Developer Platform role. Your posting describes three ways to deploy, two CI systems, and a lot of tribal knowledge, and asks for someone to make shipping safe and boring for every team. That has been my job since 2022: I own technical direction for Tidewater Commerce's internal developer platform, which 38 product teams build on.

You asked about a migration I led. At Tidewater, I led the move of 140 services from self-managed VMs to Kubernetes on AWS EKS over 5 quarters. I wrote the migration RFC, ran a weekly migration guild, and did the first 10 migrations myself as templates for the other teams. Infrastructure cost fell 31%, about $2.4M a year, and deploys went from roughly weekly per service to about 40 a day across the organization.

What I'd do differently: [Samuel — your answer goes here. See "Edits for you" in match_report.md.]

The rest of your list matches work I've done. I built Tidewater's first shared CI/CD, adopted by 25 teams, and later golden-path templates in Terraform, GitHub Actions, and Argo CD that cut new-service setup from about 2 weeks to 1 day. I chair our architecture review, wrote the service ownership and on-call RFC adopted across the org, and have mentored 6 engineers, 3 of whom were promoted to senior. I haven't run OpenTelemetry in production or used Backstage; our observability is Prometheus and Grafana.

I'd welcome a conversation about where Quillstack's platform is heading. Thank you for your time.

Sincerely,
Samuel Okafor
